

# TERMITES

Termites can fit through a 1.5mm gap.

For every human on Earth, it is estimated that there are 1,000 termites.

Termites work 24 hours a day and never sleep.

Termites may release over 150 tons of air-pollution-causing methane gas into the atmosphere every year.

The queen termite can live more than 25 years and produce 1,000 eggs each day (1 every 15 seconds) or 9 million eggs in her lifetime.

A termite colony consumes 5 grams of wood per day, or 4 pounds per year.

A typical home in the U.S. may have 3 to 4 termite colonies around it with over 1 million termites in each colony.

Termites cause \$5 billion in property damage each year in the U.S.

Termite damage is not covered by most home insurance policies.
